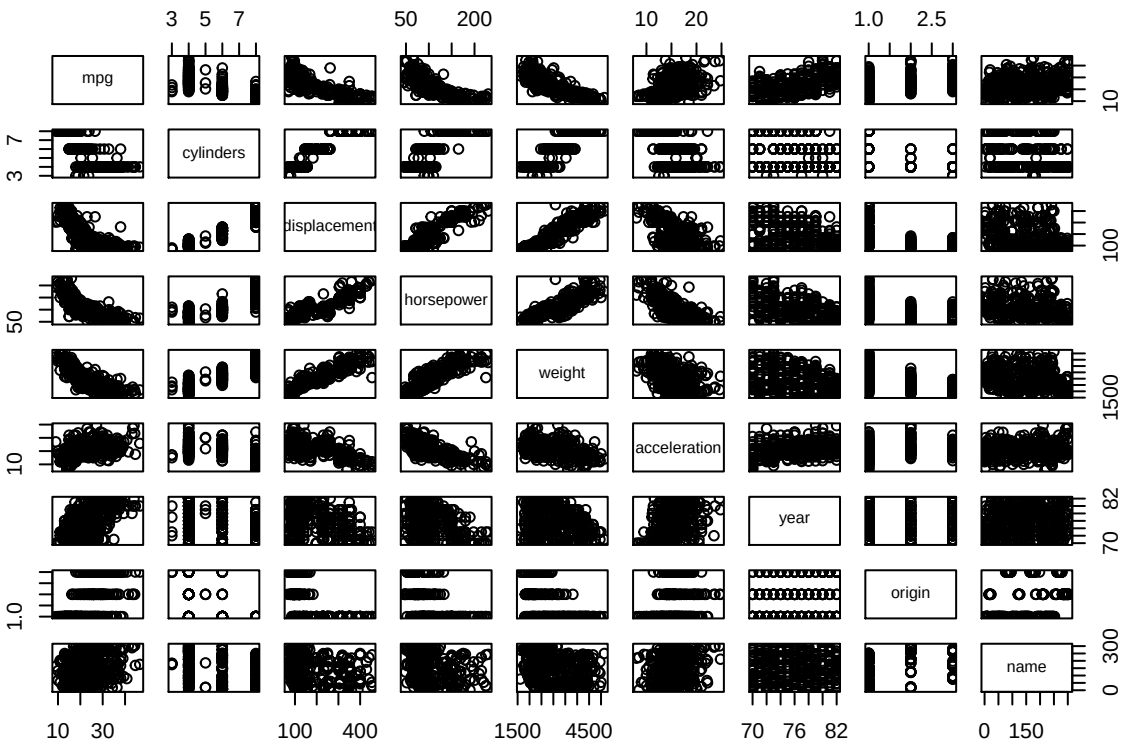
Mengxiao

Part 1

```
library(dplyr)
library(graphics)
Auto = read.csv("https://scads.eecs.wsu.edu/wp-content/uploads/2017/09/Auto.csv", na.string = '?')
Auto = na.omit(Auto)
#Auto = Auto[Auto$horsepower != '?',] #Moving out the missing data
```

a. Produce a scatterplot matrix

```
pairs(Auto)
```



b. Compute the matrix of correlations.

```
Auto2 = Auto %>% select(-name)
cor(Auto2)
```

```
##                     mpg  cylinders displacement horsepower     weight

```

c. Perform a multiple linear regression.

```
lr = lm(mpg~., data = Auto2)
summary(lr)
```

```
##
## Call:
## lm(formula = mpg ~ ., data = Auto2)
##
## Residuals:
##     Min      1Q  Median      3Q     Max
## -9.5903 -2.1565 -0.1169  1.8690 13.0604
##
## Coefficients:
##                Estimate Std. Error t value Pr(>|t|)
## (Intercept)  -17.218435   4.644294  -3.707  0.00024 ***

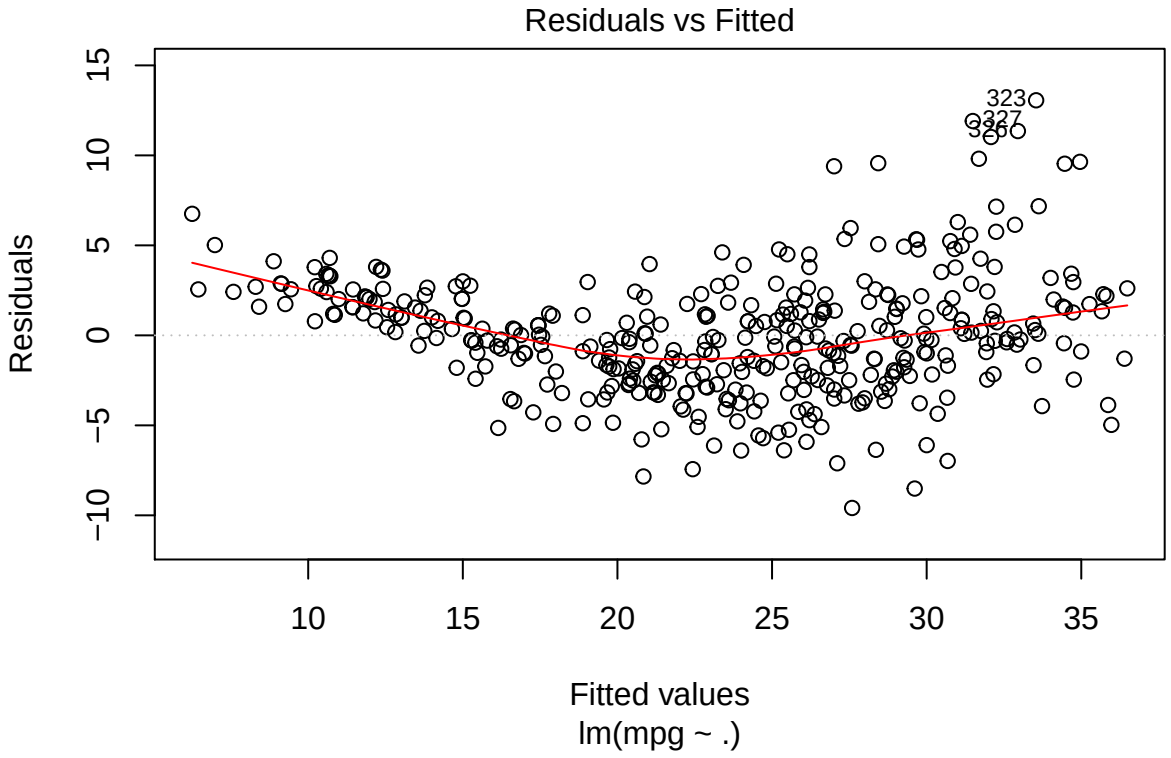
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 3.328 on 384 degrees of freedom
## Multiple R-squared:  0.8215, Adjusted R-squared:  0.8182
## F-statistic: 252.4 on 7 and 384 DF,  p-value: < 2.2e-16
```

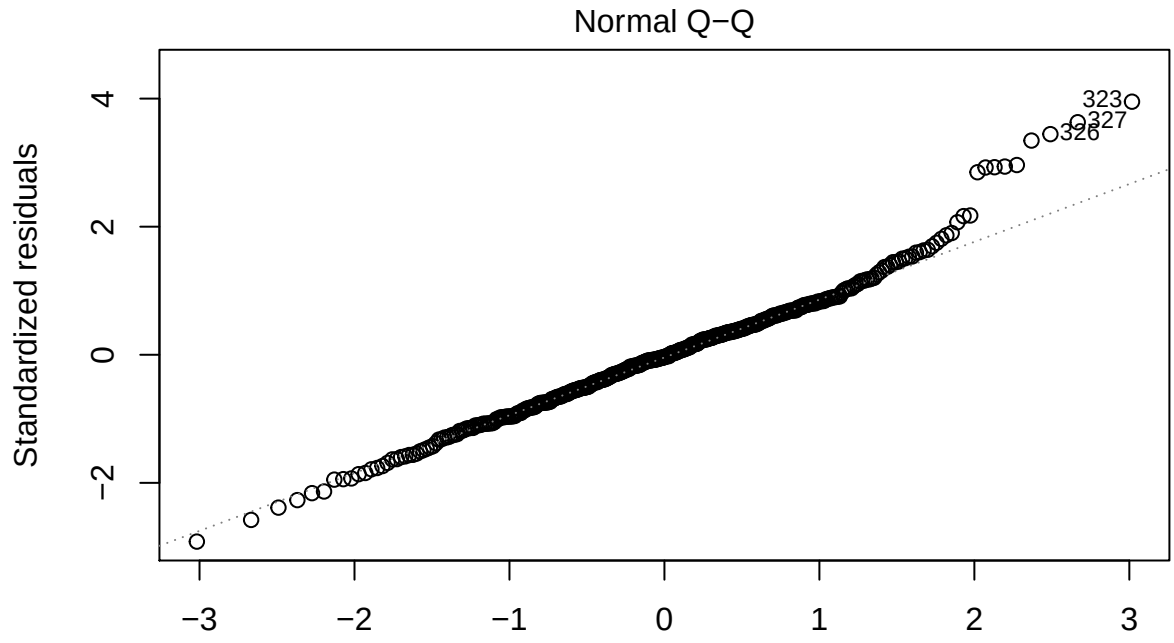
i. I think the 'origin' and 'year' are the most significant, since their absolute estimate of coefficients are the highest two.

ii. Means when the value of displacement increase 1%, the mpg will increase 0.019896%.

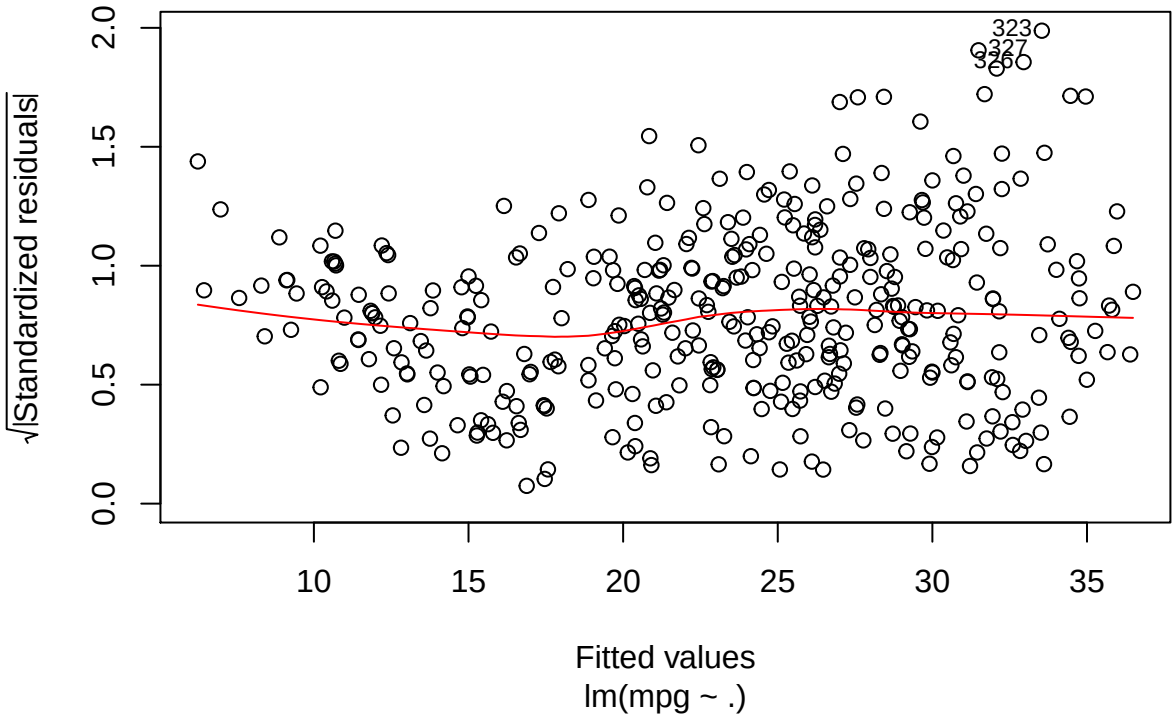
d. Produce diagnostic plots of the linear regression fit.

```
plot(lr)
```

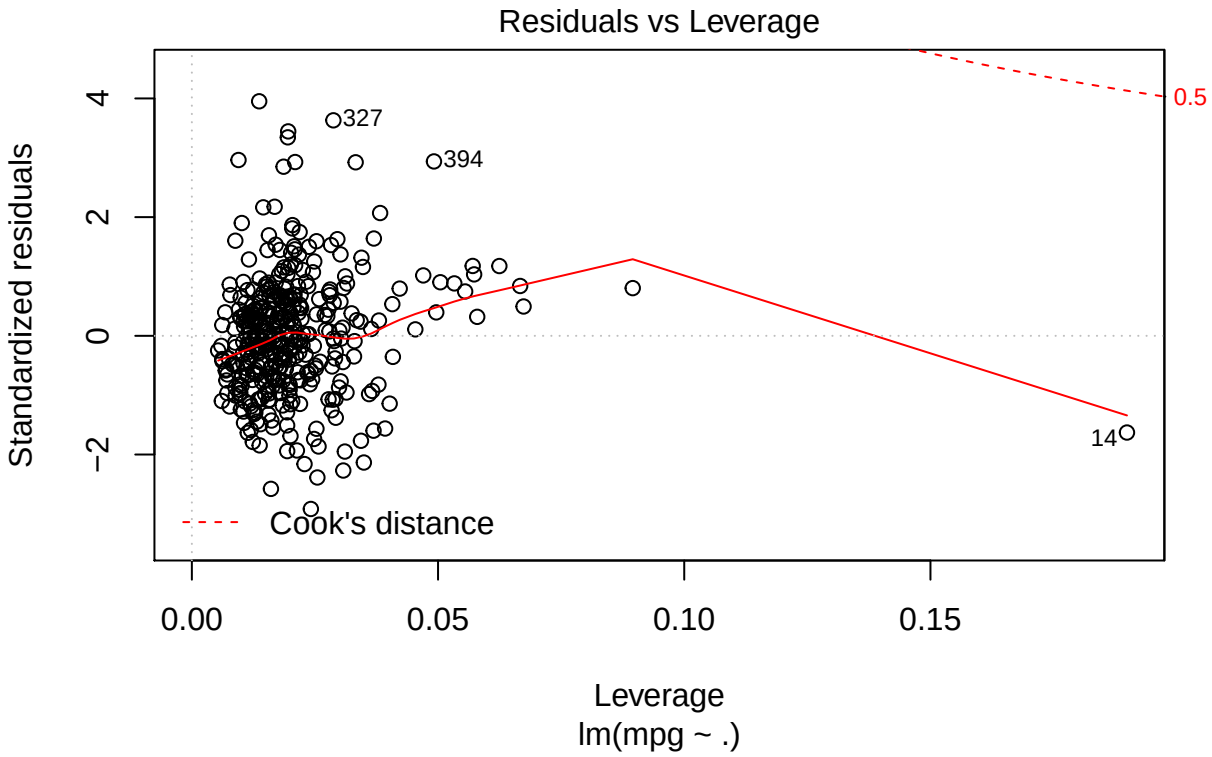




Normal Q−Q
Standardized residuals
Theoretical Quantiles
lm(mpg ~ .)
323
327
326



Scale−Location
√|Standardized residuals|
Fitted values
lm(mpg ~ .)
323
327
326



The residual plots looks good, but still have some outliers. Yes, it identifies some unusually outliers

Part 2

a.
